

CONFVS automatic packaging line

Our bagging and under vacuum packaging lines CONFVS are extremely compact. They use both aluminum bags, thermo-retractable bags and taped bags. The easy adjustments assure the best results in quality and quantity arriving till a nominal production of 720 pieces per hour.

They are used for cooked and matured products, whole or in pieces, for fresh meat and for cheese.

The automatic bagging machine receives the products, properly oriented, on its loading conveyor belt. The bags are stacked in a special adjustable storage, that should be an automatic extraction double drawer to have the best continuity in terms of production. The bagging machine feeds our under vacuum welding tunnel, that has a welding bar till 2 meters long, but it can also feed other producers' under vacuum packaging machines.

Both the bagging machine and the under-vacuum packaging tunnel can be equipped with stainless steel electronic hand-wheels that allow the machines to self-adjust to the variation of the products recipes. It's enough to choose from the operator panel of the machine (but also from a pc or a tablet for example of the production manager) the product, which parameters have been previously stored, to facilitate in this way the processes and to obtain great output results.

CONFSV AUTOMATIC PACKAGING LINE

The machine are really safe thanks to perimeter safety barriers , that can be on the machines or around them, but that are always very compact, but they are also accessible for loading, unloading, adjusting, washing and servicing operations. Both the machines can communicate with factory production management programs and receive technical assistance from remote.
